

Task Card 2 · PRD to Clickable Prototype

1 h 45 min hands-on · Claude Design / Claude Desktop · [From requirements to clickable mobile flow](#) · For UX designers

The goal

Go from requirements text to a clickable prototype in under an hour — and learn where the AI hits the right UX patterns on its own, and where you must steer it.

The task

Build a clickable **mobile** prototype of the **inspector's core flow** in a playground inspection app. The flow is described in **BRIEF-INSPECTION-FLOW.md** (an excerpt from a real PRD).

The flow in short: **My inspections** → **start inspection** → **checklist item by item** → **log a deviation with photo and risk class** → **sign off and finish**.

Design constraints to hold the AI to:

- Mobile first. Large touch targets — one hand must be enough; think gloves and rain.
- Clear states: OK (green), Deviation (red), Not applicable (grey).
- Risk class A must *feel* serious in the UI.

Starter prompt (suggestion)

Build a clickable mobile prototype (interactive, not static images) of the flow in the attached brief. Mobile first, large touch targets. Start at the "My inspections" screen and make the whole flow clickable through to sign-off. Stick to the brief - do not invent extra features.

Attach **BRIEF-INSPECTION-FLOW.md** in the chat.

Suggested timeline

TIME	STEP
0:00–0:10	Read the brief. Sketch the screens on paper (5 min is enough).
0:10–0:50	Prompt out a first version of the whole flow. Click through it.
0:50–1:30	Iterate screen by screen: one problem per prompt. Try "redo the deviation view with [your pattern]" and compare.
1:30–1:45	Lightning demo: click through the flow on your own screen.

Variant for reviewers rather than builders

Upload screenshots of an existing Sokigo product and have Claude run a **heuristic evaluation** (Nielsen's 10 heuristics) with severity per finding, then a redesign of the worst view. Compare the AI's findings with your own gut.

DONE WHEN

The prototype clicks through the entire flow on your screen — or the heuristic evaluation is done and you have one redesigned view to show. No export needed.

IF YOU GET STUCK

Come to the AI table. Most common: the prototype grows too wide (ask Claude to cut everything outside the core flow) or too desktop-ish (repeat "mobile first, max 400 px wide").
