

Task Card 3 · Build a Writing-Style Skill

1 h 45 min hands-on · Claude Desktop · **No programming — package your expertise as a skill** · For technical writers

The goal

Feel the difference between **re-prompting the same thing every time** and **packaging knowledge once** so the AI carries it itself. A skill is a text file of rules and examples that Claude loads when relevant — no coding, just writing. That is exactly your expertise, in a new format.

The task

1. Create a **SKILL.md** that packages Sokigo's writing rules: tone, terminology, formatting, right/wrong examples. Start from **SKILL-TEMPLATE.md**.
2. **Test it scientifically:** take the test text in **TEST-TEXT.md** (messy developer notes) and ask Claude to turn it into release notes — first **without** the skill, then **with** it. Compare.
3. Iterate on the skill until the difference is unmistakable: sharpen rules, add examples for mistakes Claude still makes.

Using the skill during the workshop

Simplest path today: start a new chat and paste your whole SKILL.md with the instruction *"Follow these writing rules in everything you write in this chat"* — that gives the same comparison. To make it permanent: add it as instructions in a Project, or ask at the AI table how skills are installed in Claude Desktop / Claude Code on your account.

Suggested timeline

TIME	STEP
0:00–0:15	Baseline: have Claude write release notes from TEST-TEXT.md without rules. Save the result.
0:15–0:50	Write your SKILL.md from the template. Be concrete: WRONG/RIGHT pairs beat abstract principles.
0:50–1:20	Run the same test text with the skill. Compare against the baseline. Iterate: every remaining mistake = one new rule or example.
1:20–1:45	Bonus if time allows: run the skill on a real text (help article, release notes). Lightning demo: show before/after side by side.

DONE WHEN

The same source text produces visibly different results with and without the skill, and you can show the comparison. Bonus: you can point at one specific rule in the skill and exactly where it showed up in the output.

The takeaway

What you built is reusable: the same SKILL.md works in Claude Desktop, in Projects and in Claude Code. The next step after the kickoff is turning it into a shared skill for the whole organization — then everyone writes Sokigo texts with your rules built in.

IF YOU GET STUCK

Come to the AI table. Most common: the skill is too abstract ("write clearly") — switch to concrete rules with examples ("write 'you', not 'the user'"; WRONG: ... RIGHT: ...").
